Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Stimulating/inhibiting insulin release with exendin polypeptide(s) -
for treating diabetes mellitus and preventing hyperglycaemia.
Graim 1: Columns 13-14: 17pp: English.
R80543 is the Heloderma suspectum exendin 4 residues 1-31. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin (in)dependent mechanisms.
Sequence 31 AA;
                                                                                                         R80543;
27-FEB-1996 (first entry)
Heloderma suspectum exendin-4 residues 1-31 (Exendin-4(1-31)).

The Pile od intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance

Claims 17, 25; Page 8; 214pp; English.

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model).

The present sequence is that of exendin-4 which is one of the preferred companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Regulating gastrointestinal motility using exendins or their agonists for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations Claims 20 and 21; Fig 1; 70pp; English.
W47549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (W47608) or exendin-4
syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-in) dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-FEB-1996 (first entry)
Heloderma suspectum exendin-4.
Exendin-4; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Stimulating/inhibiting insulin release with exendin polypeptide(s) for treating diabetes mellitus and preventing hyperglycaemia. Claim 6; Columns 13-14; 17pp; English. R80346 is Heloderma suspectum exendin-4. It is an
                                          Exendins, components of Glia monster venum, many components similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia.

Fig. 1935, 933103.

The includent acid encoding proexendin - used to diagnose and treat, e.g. endocrine tumours, also to treat poisoning by reptile venom as includent acid encoded by its constant as isolated from a H. suspectum salivary gland cDNA library.

The Proexendin protein comprises of a novel exendin N-terminal peptide (ENTP) linked to the N-terminus of the exendin A peptide by a consensus dipeptidyl peptidase cleavage site. The proexendin conn is gene of Heloderma horidum, mutant alleles and proexendin gene of Heloderma horidum, mutant alleles and proexendin gene of Heloderma horidum, mutant alleles and proexendin gene regulatory defects associated with metabolic disease) and species homologues (e.g. for developing animal models for drug screening). The proexendin peptide can be used to raise antibodies. Anti-proexendin antibodies are claimed to be useful for diagnosing conditions associated with altered levels of proexendin (e.g. endocrine tumours and organ failure), for identifying other regulators of cell metabolism, in drug screens and for treating metabolic diseases (e.g. diabetes) and for neutralising, or detecting, reptilian venom peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance claims 16, 24; Page 8; 214pp; English.

Claims 16, 24; Page 8; 214pp; English.

The invention relates to a new method for treating disorders that are are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer lasting action (still effective after 6 hours in a mouse model).

The present sequence is that of exendin-3 which is one of the preferred compounds for use in the method.

WEST 95-262627/34.

Stimulating finititing insulin release with exendin polypeptide(s) Stimulating finititing insulin release with exendin polypeptide(s) for treating diabetes mellitus and preventing hyperglycaemia.

Claim 5: Columns 13-14; 17pp; English.

R80545 is Heloderma horridum exendin-3. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin-(in)dependent mechanisms.

Score 220; DB 14; Length 39;

Heloderma horridum exendin-3.
Exendin-3; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
Reloderma horridum.

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-30) or its amide which is sequence 30 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                              29-WAR-1999 (first entry)
Exendin-4 (1-30) for use in treating disorders related to food intake.
Exendin; obesity: type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Heloderma suspectum exendin-4 residues 1-31-Tyr31.
Exendin-4; residues 1-31; Y-31-Exendin-4(1-31); diabetes mellitus; hyperglycaemia; Tyr31; insulinotropic peptide.
                                                 similarity to glucagon-like peptides (GLP). They are GLP agonists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia. Sequence 39 AR:
   investigation, particularly radiological or by magnetic resonance
                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

PT TUNDCACTE OF VERSIONS OF Exendin peptide(s) for treating diabetes -

Increase secretion and blosynthesis of insulin, but reduce those of

glucagon, and do not induce hypoglycaemia

PT Increase secretion and blosynthesis of insulin, but reduce those of

glucagon, and do not induce hypoglycaemia to reduce those of

rich speptide is a fragment of exendin-4 isolated from Heloderma

horridum. This peptide and its aalts, esters and derivatives can be

conserted that activity can increase peripheral glucagon, and

independent of this activity can increase peripheral glucagon, and

independent of this activity can increase peripheral glucagon, and

independent of this activity can increase peripheral glucagon.

Exendin-3 and exendin-4 are only active when blood sugar levels are

Exendin-3 and exendin-4 are only active when blood sugar levels are

Exendin-3 and exendin-4 are only active when blood sugar levels are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                longer lasting effect. Truncated forms of this peptide can be made more economically than full length versions.
                                                                                             WELL 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) -
for treating diabetes mellitus and preventing hyperglycaemia.

Claim 2; Columns 13-14; 17pp; English.

R80544 is the Heloderma suspectum exendin 4 residues 1-31, where
the native pro31 has been replaced with a Tyr residue. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin_(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                    Truncated versions of exendin peptide(s) for treating diabetes -
increase secretion and biosynthesis of insulin, but reduce those of
increase secretion and biosynthesis of insulin, but reduce those of
alwagon, and do not induce hypoglycaemia
Claim 2: Page 22: 150pp; English.

Peptides w39303-W39420 are fragments of exendin-3 and exendin-4
isolated from Heloderma horridum which are used in a novel method
for the treatment of diabetes mellitus. These peptides can simulate
biosynthesis and secretion of insulin, but have the opposite effect on
glucagon, and independent of this activity can increase peripheral
culcagon, and independent of this activity can increase peripheral
culcagon, and independent of this activity can increase peripheral
culcagon are high, so they will not induce hypoglycaemia. Compared
with glucagon-like peptide 1 (GLPI) and the known exendins, they are more
active (effective at lower doses), more stable to degradation and
metabolism and have a longer lasting effect. Truncated forms of this
peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance (laims 18, 26; Page 12; 21/4pp; English.

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     29-MAR-1999 (first entry)
Exendin-4 (1-28) amide for use in treating disorders related to food.
Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Truncated versions of exendin peptide(s) for treating diabetes -
Increase secretion and blosynthesis of insulin, but reduce those of
gluadgon, and do not induce hypoglycaemia
claim 2: Page 27: 150pp; English.

Peptides w39303-W39420 are fragments of exendin-3 and exendin-4
isolated from Heloderma horridum which are used in a novel method
for the treatment of diabetes mellitus. These peptides can stimulate
blosynthesis and secretion of insulin, but have the opposite effect on
glucagon, and independent of this activity can increase peripheral
glucagon, and independent of this activity can increase peripheral
glucagon. Exendin-3 and exendin-4 are only active when blood
sugar levels are high, so they will not induce hypoglycaemia. Compared
with glucagon-like peptide (Girl) and the known exendins, they are more
active (effective at lower doses), more stable to degradation and
metabolism and have a longer lasting effect. Truncated forms of this
peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-28) amide which is one of the preferred compounds for use in the method.
Sequence 28 AA;
                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   H. horridum exendin-3 peptide derivative #11.

NT Exendins are venom components that are thought to bind to receptors
for vascactive intestinal peptide and/or secretin on pancreatic
acinar cells and activate adenylate cyclase, resulting in
secretion of amylase.

STURM N.S., LIN Y., BURLEY S.K., KRSTENANSKY J.L., AHN J.M.,
AZIZEH B.Y., TRIVEDI D., HRUBY V.J.;
"Structure-function studies on positions 17, 18, and 21 replacement
analogues of glucagon: the importance of charged residues and salt
bridges in glucagon blological activity.";
J. MED. CHEM. 41:A593-2700(1998).
I- FUNCTION: PROMOTES HYDROLISIS OF GLYCOGEN AND LIPIDS, AND RAISES
THE BLOOD SUGAR LEVEL.
INDUCTION: PRODUCED IN THE A CELLS OF THE ISLETS OF LANGERHANS
IN RESPONSE TO A DROP IN BLOOD SUGAR CONCENTRATION.
-- SIMILARITY: BELONGS TO THE GLUCAGON FAMILY.

```
Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, analogues - for treatment of e.g. obesity, type II diabetes, cating disorders and insulin resistance of the invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment comprises administering an exendin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 which is one of the preferred compounds for use in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin or an exendin agonist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-3 which is one of the preferred sequence 39 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      29-MAR-1999 (first entry)

Heloderma horridum exendin-3.
Exendin-3; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
Heloderma horridum.
                                                                                                                                                                                                                                                                                                                                                                                                 Regulating gastrointestinal motility using exendins or their agonists for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations claims 20 and 21; Fig 1; 70pp; English.
W47549 describes a generic exendin agonist, provided that it does have the formula of either exendin-3 (W47608) or exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Stimulating/inhibiting insulin release with exendin polypeptide(s) for treating diabetes mellitus and preventing hyperglycaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin agonists, which reduce gastric motility and delay gastric emptying, can be used to treat spasm (where associated with acute diverticulties or disorders of the biliary tract or sphincter of oddi), postprandial dumping syndrome and hyperglycaemia (particularly associated with type 2 diabetes), type 1 diabetes, impaired glucose tolerance, toxin ingestion (an exendin agonist is administered to prevent stomach contents passing into the intestines, then the stomach pumped) and obesity. They can also be administered to subjects undergoing gastrointestinal diagnostic
                                                                                                                                  Gila monster exendin-3.

Exendin agonist; gastric motility; gastric emptying; treatment; spasm; postprandial dumping syndrome; postprandial hyperglycaemia; type 1 diabetes; impaired glucose tolerance; toxin ingestion; obesity; Gila monster venom; exendin-3.

Heloderma horridum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendins, components of Gila monster venom, have some sequence similarity to glucagon-like peptides (GLP). They are GLP agenists and have been suggested (US5424286) for treatment of diabetes and prevention of hyperglycaemia.

Claim 6; Columns 13-14; 17pp; English.
RR0546 is Heloderma suspectum exacdin-4. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in)dependent mechanisms.
Claim 5; Columns 13-14; 17pp; English. R. 880545 is Heloderma horridum exendin.3. It is an insulinotropic peptide, and can therefore be used in the treatment of diabetes mellitus (types I or II), and for the prevention of hyperglycaemia. It normalises hyperglycaemia through glucose-dependent and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  27-FBB-1996 (first entry)
Heloderma suspectum exendin-4.
Exendin-4; diabetes mellitus; hyperglycaemia; insulinotropic peptide.
Heloderma suspectum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Regulation gastrointestinal motility using exendins or their agonists - for treating spasm, diabetic postprandial hyperglycaemia, impaired glucose tolerance etc., also in diagnostic investigations

Heloderma suspectum proexendin peptide.
Heloderma suspectum proexendin; exendin N-terminal peptide; ENTP;
exendin 4 peptide; exendin 3 gene; Heloderma horridum; metabolic disease;
drug screening; endocrine tunur; organ failure; cell metabolism;
diabetes; reptilian venom peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The Heloderma suspectum proexendin peptide is encoded by its CDNA which was isolated from a H. suspectum salivary gland cDNA library. The proexendin protein comprises of a novel exendin N-terminal peptide (EMTP) linked to the N-terminal of the exendin 4 peptide by a consensus dipeptidyl peptidase cleavage site. The proexendin companies to clone or identify related sequences (e.g. the exendin 3 gene of Heloderma horridum, mutant alleles and proexendin gene regulatory defects associated with metabolic disease) and species the proexendin peptide can be used to raise antibodies. Anti-proexendin antibodies are claimed to be useful for diagnosing conditions associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, eating disorders and insulin resistance caring disorders and insulin resistance caring disorders and insulin resistance caring disorders to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eating disorders, insulin resistance syndrome, elevated plasma glucose levels, or the risk of cardiac disease. The method comprises administering an exendin aponist. The treatment reduces appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholecystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of an exendin-4 variant which is one of
failure), for identifying other regulators of cell metabolism, in drug screens and for treating metabolic diseases (e.g. diabetes) and for neutralising, or detecting, reptilian venom peptides. Sequence 87 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Leu(14), Phe(25)-exendin-4 amide, for reducing food intake.
Exendin; obesity, type II diabetes; eating disorders; cardiac disease;
insulin resistance syndrome; elevated plasma glucose level; agonist.

Reducing food intake by administering exendins or their analogues - for treatment of e.g. obesity, type II diabetes, analogues - for treatment of e.g. obesity, type II diabetes, analogues - for treatment of e.g. obesity, type II diabetes, and insulin resistance

The invention relates to a new method for treating disorders that are alleviated by reducing food intake, in particular obesity, type II diabetes, eathing disorders, insulin resistance syndrome, elevated II diabetes, eathing disorders, insulin resistance syndrome, elevated Comprises administering an exendin or an exendin agonist. The method comprises appetite and lowers plasma lipid levels. It inhibits food comprises appetite and lowers plasma lipid levels. It inhibits food consumption as effectively as amylin or cholesystokinin but has a much longer-lasting action (still effective after 6 hours in a mouse model). The present sequence is that of exendin-4 (1-30) or its amide which is common and the preferred compounds for use in the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                         WPI: 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Stimulating/inhibiting insulin release with exendin polypeptide(s) -
for treating diabetes mellitus and preventing hyperglycaemia.

Claim 1: Columns 13-14; 17pp; English.

R80543 is the Heloderma suspectum exendin-4 residues 1-31. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin-4 (1-30) for use in treating disorders related to food intake. Exendin; obesity; type II diabetes; eating disorders; cardiac disease; insulin resistance syndrome; elevated plasma glucose level; agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note- "optionally the C-terminal is in amide form"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

Goeke B. Goeke R. Hoffmann E;
Truncated versions of exendin peptide(s) for treating diabetes -
Increase secretion and biosynthesis of insulin, but reduce those of
Increase secretion and biosynthesis of insulin, but reduce those of
Jucagon, and do not induce hypoglycaemia
Claim 2; Page 27: 150pp; English.

CR peptides w39303-W39420 are fragments of exendin-3 and exendin-4
CC peptides w39303-W39420 are fragments of diabetes melitus. These peptides can stimulate
CC for the treatment of diabetes mellitus, These peptides can stimulate
CC for the treatment of insulin, but have the opposite effect on
Glucagon, and independent of this activity can increase peripheral
CC glucose utilisation. Exendin-3 and exemplin-4 are only active When blood
CS sugar levels are high, so they will not induce hypoglycaemia. Compared
CC with glucagon-like peptide 1 (GLP1) and the known exendins, they are more
CC active (effective at lower doses), more stable to degradation and
CM metabolism and have a longer lasting effect. Truncated forms of this
CC peptide can be made more economically than full length versions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                      WPI; 95-262627/34.

Stimulating/inhibiting insulin release with exendin polypeptide(s) -
Stimulating/inhibiting insulin release with exendin polypeptide(s) -
for treating diabetes mellitus and preventing hyperglycaemia.

Claim 2; Columns 13-14; 17pp; English.

R80544 is the Heloderma suspectum exendin-4 residues 1-31, where
the native Pro31 has been replaced with a Tyr residue. It is an
insulinotropic peptide, and can therefore be used in the treatment of
diabetes mellitus (types I or II), and for the prevention of
hyperglycaemia. It normalises hyperglycaemia through glucose-dependent
and insulin-(in)dependent mechanisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                05-JUN-1998 (first entry)

Truncated versions of exendin peptide(s) for treating diabetes -
Increase secretion and blosynthesis of insulin, but reduce those of
increase secretion and blosynthesis of insulin, but reduce those of
glucagon, and do not induce hypoglycaemia

Claim 1; Page 3; 150pp; English.

This peptide is a fragment of exendin-3 isolated from Heloderma

Chorridum. This peptide and its salts, esters and derivatives can be
used to treat diabetes mellitus. They stimulate blosynthesis and
secretion of insulin, but have the opposite effect on glucagon, and
independent of this activity can increase peripheral glucose utilisation.

Exendin-3 and exendin-4 are only active when blood sugar levels are
high, so they will not induce hypoglycaemia. Compared with glucagon-like
peptide 1 (GIP) and the known exendins, they are more active (effective
at lower doses), more stable to degradation and metabolism and have a
longer lasting effect. Truncated forms of this peptide can be made more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Truncated versions of exendin peptide(s) for treating diabetes increase secretion and biosynthesis of insulin, but reduce those of glucason, and do not induce hypoglycaemia [Claim 1: Page 4: 150pp; English.
This peptide is a fragment of exendin-4 isolated from Heloderma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            M39302 standard; peptide; 30 AA.
M39302 standard; peptide; 30 AA.
M39302;
US-JUN-1998 (first entry)
H. horridum exendin-4 peptide.
Exendin-3; exendin 4; dlabetes; insulin; secretion; blosynthesis; glucagon reduction; hypoglycaemia; glucose; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note- "This residue can be any amino acid except Gly"
                                                                                                  05-JUN-1998 (first entry)
H. horridum exendin-3 peptide.
H. saxodin-3; exendin-4; diabetes; insulin; secretion; biosynthesis; glucagon reduction; hypoglycaemia; glucose; treatment.
Heloderma horridum.
                                                                                                                                                                                                                                                                                                                                           /note= "This residue can be any amino acid except Gly"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       71.8%; Score 158; DB 29; Length 30; 100.0%; Pred. ```
horridum. This peptide and its salts, esters and derivatives can be used to trast diabetes mellitus. They stimulate blosynthesis and secretion of insulin, but have the opposite effect on glucagon, and independent of this activity can increase peripheral glucose utilisation. Exendin-3 and exendin-4 are only active when blood sugar levels are high, so they will not induce hygoglycamia. Compared with glucagon-like peptide 1 (GLP1) and the known exendins, they are more active (effective at lower doses) more stable to degradation and metabolism and have a economically than full length versions.

"Molecular cloning and complete nucleotide sequence of the attenuated rabies virus SAD B19.";
VIROLOGY 175:485-499(199)
-:- FUNCTION: THIS PROTEIN IS PROBABLY A COMPONENT OF THE ACTIVE POLYMERASE. IT MAY FUNCTION IN RNA SYNTHESIS, CAPPING, AS WELL AS METHYLATION OF CAPS, AND POLY(A) SYNTHESIS.
-:- SUBUNIT: THOUGHT TO POPEN A TRANSCRIPTION COMPLEX WITH THE NUCLEOCAPSID (N) PROTEIN.
-:- SIMILARITY: WITH THE L PROTEIN OF OTHER RHABDOVIRUSES AND
                                                                                                                                      MEDLINE; 92218391.
